\land WARNING

HAZARDOUS VOLTAGE.

Can shock, burn or cause serious injury.

Do not work inside the equipment unless totally familiar with electrical circuits.

小

Do not approach the antenna closer than the distances shown below when the antenna is transmitting.

The antenna emits radio waves that can be harmful to the human body.

RF power density on antenna aperture	Distance	Description required by
100 W/m ²	0.12 m	IEC 60945
10 W/m ²	0.39 m	IEC 60945
2 W/m ²	0.89 m	MPE by FCC

(MPE: Minimum Permissible Exposure)

Turn off the power at the mains switchboard before beginning the installation.

Post a warning sign near the switchboard to indicate that power should not be applied while the equipment is being installed.

Electrical shock, serious injury or fire can result if the power is not turned off or is applied while the equipment is being installed.

Ground the transceiver unit.

Ground the transceiver unit to prevent electrical shock and interference.

Confirm that the power supply voltage is compatible with the voltage rating of the equipment.

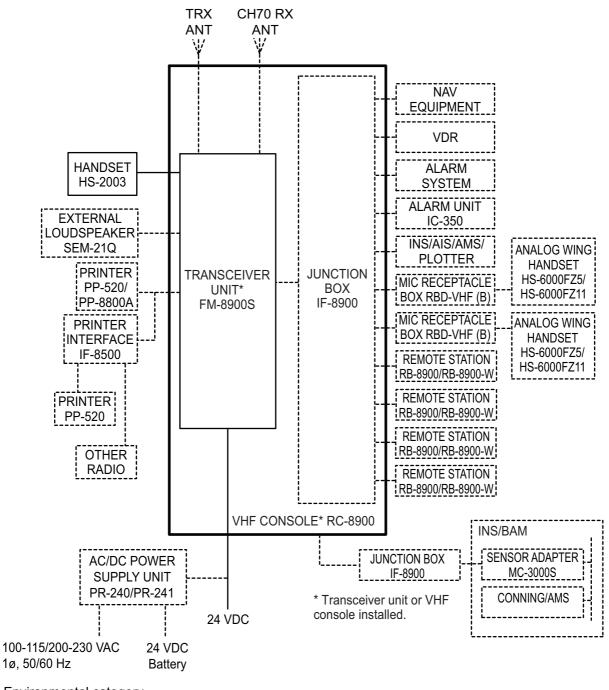

Connection to the wrong power supply can cause fire or damage the equipment.

Follow the compass safe distances to prevent interference to a magnetic compass.

	Standard compass	Steering compass
FM-8900S	0.50m	0.30m
IF-8900	2.05m	1.35m
HS-2003	1.50m	0.95m

1. HOW TO INSTALL THE EQUIP-MENT

This chapter shows you how to install the units of the system. The transceiver unit and handset are standard supply. All other units are optional supply. (The junction box is standard supply in some installations.)

1.1 Transceiver Unit FM-8900S

1.1.1 General installation remarks

The transceiver unit can be installed on a desktop (with hanger), under a desktop, overhead, bulkhead, or in a console (requires a flush mount kit). Select a location where the controls can be easily operated and a location that is near the power source and the ground location. Additionally, select a location that meets the following conditions:

- Select a location away from water spray and water splash.
- All outdoor installed connectors on coaxial cables should be fitted with preventive isolation such as vulcanizing tape to protect against water penetration into the antenna cable. Also, apply marine sealant at the antenna base to prevent water intrusion from the screw part of antenna base.
- The location must not be in direct sunlight, because of heat that can increase inside the unit.
- Leave some additional length in cables to allow a service technician to move the radio from its normal location with the cables connected.
- Do not install the unit where flammable gases are stored.
- Select a location that provides good ventilation.
- Make sure the location can hold the weight of the unit under the condition of continued vibration normally found on the ship. If necessary, strengthen the location. For added support use nuts, bolts and washers (instead of self-tapping screws) to fasten the unit.
- Leave enough space at the sides and rear of the unit for maintenance and service purposes and to provide cool air. See the outline drawings at the back of this manual for recommended service space.
- For Solas Convention vessels, the mounting location must satisfy the conditions of Regulations 22 Navigation bridge visibility.
- For installation in a console, select a location where the display can be easily seen.
- The transceiver unit causes interference to a magnetic compass if put too close to the compass. Follow the compass safe distance in the safety instructions to prevent interference to a magnetic compass.

1.1.2 Desktop, bulkhead, overhead installation

- 1. Use the hanger as a template to mark the fixing holes in the installation location.
- 2. Fix the hanger to the location with the self-tapping screws and washers (supplied). (For the overhead mount, use nuts, bolts and washers instead of the self-tapping screws.)
- 3. Screw the knob bolts with the washers into the transceiver unit.
- 4. Set the transceiver unit to the hanger and tighten the knob bolts.

1.1.3 Console installation (flush mount, option)

Requires the optional flush mount kit (OP05-129), the contents of which are shown in the table below. Follow the instructions in the outline drawing to install the unit in a console.

Name	Туре	Code no.	Qty
Mounting Plate	05-104-2603	100-370-030-10	1
Self-tapping Screw	5×20	000-802-081	4
Hex Screw	M8×16	000-882-075	2

1.2 VHF Antenna

1.2.1 Requirements for the antenna

Any good quality antenna that meets the requirements shown below can be used.

- Frequency range: 155 to 164 MHz
- Impedance: 50 ohms
- Polarization: Vertical
- Handling power: 30 W
- Quality: Withstand the marine environment

1.2.2 Installation location

The location and installation of different antennas on a ship is important to ensure effective communications. Incorrectly installed antennas will degrade performance of the radio equipment and reduce the range of communications.

Select the location for the antenna considering the following points.

- VHF antennas should be placed in a position which is as elevated and free as possible, with at least 2 meters horizontal separation from constructions made by conductive materials.
- Ideally there should not be more than one antenna on the same level.
- The location of mandatory VHF antennas should be given priority compared with mobile telephone antennas. If they are located on the same level, the distance between them should be at least 5 meters.

1.2.3 Mounting procedure

The basic mounting procedure for the antennas supplied by FURUNO is as follows; however, consult appropriate outline drawing for details.

- 1. Fasten the antenna bracket to the stanchion.
- 2. Set the antenna to the antenna bracket and tighten bolts.
- 3. Screw the coaxial cable plug into the antenna.

1.3 CH70 RX Antenna

The antenna must be separated from the antennas, masts, and other objects that can cause interference. Follow the recommended separation distances in section 1.2.2. The installation procedure is like that for the VHF antenna. See the outline drawing.

1.4 Handset Hanger

Install the handset hanger to the left of the transceiver unit. The location must provide easy access to the front panel controls while you operate the handset. The length of the standard handset cable is 50 cm. Put the handset hanger within 50 cm of the unit. (Longer cables are available.)

1.5 AC-DC Power Supply Unit PR-240/241

For Solas Convention vessels, both AC and DC power must be supplied to the transceiver unit, through an AC/DC power supply. When the AC input fails, DC power is supplied. FURUNO can supply an AC/DC power supply unit, the PR-240/241. Provide protective earth. See chapter 2.

1.5.1 Installation location

Select the location that meets the following conditions:

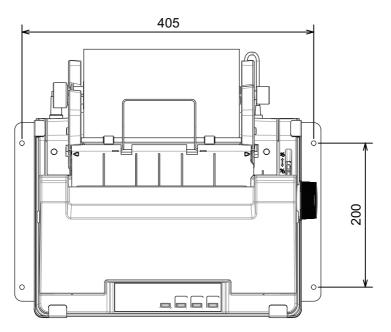

- · Select a location that provides good ventilation.
- The location must be clean and dry.
- Make sure the location can hold the weight of the unit under the condition of continued vibration normally found on the ship.
- The power supply unit will affect the performance of a magnetic compass if put near the compass. Follow the compass safe distance in the safety instructions to prevent the interference to a magnetic compass.

1.6 Printer

1.6.1 Printer PP-520

See the outline drawing for installation instructions.

- 1. Decide the location for the printer.
- 2. Set the ink ribbon cartridge and the roll paper to the printer. See the PP-520's Operator's Manual for the procedures.
- 3. Set the fixtures (left/right) to the printer, and fasten them with four self-tapping screws (ϕ 5x20).

1.6.2 Printer PP-8800A

See the outline drawing at the back of this manual for information. This printer cannot be connected to the Printer Interface IF-8500.

- 1. Make a cutout of 208(W)×133(H) mm in the mounting location.
- 2. Set the printer to the cutout and fasten the printer with four self-tapping screws (4×16) .

1.7 Printer Interface IF-8500

The Printer Interface IF-8500 allows the FM-8900S and other MF/HF radio communication equipment to share the Printer PP-520. See the outline drawing at the back of this manual for installation instructions.

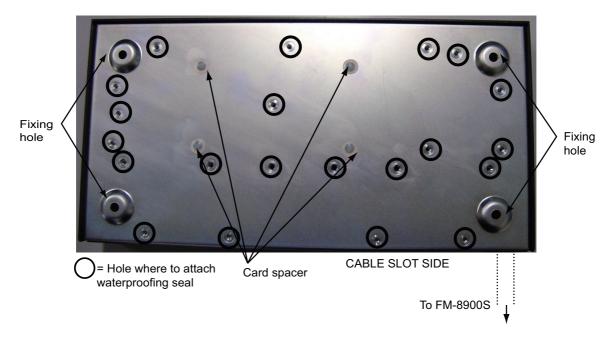

1.8 Loudspeaker SEM-21Q

The loudspeaker can be installed on a desktop, the overhead or a bulkhead. Fasten the loudspeaker with the self-tapping screws, or nuts, bolts and washers. See the outline drawing at the back of this manual for dimensions.

1.9 Junction Box IF-8900

The junction box can be mounted on a desktop or bulkhead, and is required to connect the remote station, wing handset, etc. Put the unit within 5 m of the transceiver unit, because that is the length of the cable connected between the units.

For the bulkhead mount, it is necessary to cover holes in the bottom of the unit to comply with the Ingress Protection Rating IPx2. Waterproof seals (Type: OP05-133, Code no.: 001-174-890) are optionally available for this purpose. Set them to the open holes on the underside of the junction box as shown below, BEFORE installing the junction box.

To install the junction box, open the cover and fasten the box with four self-tapping screws (5×20). Close the cover.

1.10 Remote Station RB-8900, Watertight Remote Station RB-8900-W

A maximum of four remote stations can be installed.

- 1. Remove six screws on the handset hanger.
- 2. Remove upper chassis of the hanger.
- 3. Fasten the base of the hanger to a bulkhead with two self-tapping screws (4×20).
- 4. Connect the cables to the remote station then assemble the remote station.

1.10.1 How to install the Watertight Remote Station outdoors

The Watertight Remote Station RB-8900-W (with Watertight Remote Handset HS-8900-W) can be installed outside if it is contained in a waterproof enclosure. As shown below, apply the silicone sealant to the hanger to waterproof the hanger.

Be sure to put the RB-8900-W in a waterproof enclosure when the unit is installed outside. The waterproofing category of the RB-8900-W is IEC 60529 IP56. However, protect the unit from the weather (IEC 60945).

Before you close the hanger with the silicone sealant (for waterproofing), do the termination setting (only for termination device, see section 2.11) and connect the cables. Do not open the hanger after it has been sealed.

- 1. Fasten the mounting base with the self-tapping screws. Apply the silicone sealant to the exposed part of those screws.
- 2. Attach the cable from the transceiver unit or junction box. Apply the silicone sealant to the cable around the cable entrance.
- 3. Confirm that the plastic washers are in the screw holes. Fasten the cover of the handset hanger. Apply the silicone sealant to the junction between the mounting base and the cover.

2. Apply silicone sealant to cable entrance.

 Apply silicone sealant to self-tapping screws.

3. Apply silicone sealant to junction.

1.11 VHF Console RC-8900

Install the VHF console where you can easily operate the equipment in the console and do maintenance and service. Meet with shipyard personnel and ship's officer-incharge to select the best location. The location must meet the following points:

- · Select a location where you can operate controls easily.
- Select a location where shock and vibration are the least possible.
- Select a location away from water splash and rain.
- The temperature and humidity of the location must be both stable and moderate.

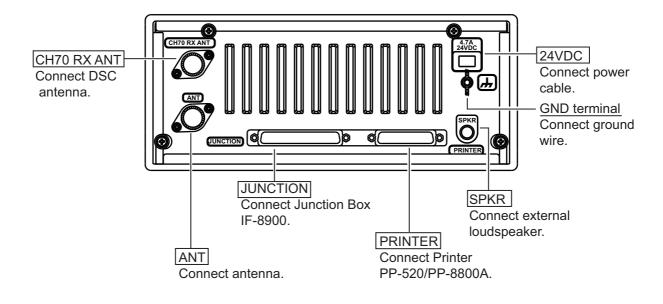

How to install the console

- 1. Ask shipyard personnel to tighten six M5 nuts or six M5 bolts to the fixing holes (on the bulkhead), referring to the outline drawing at the back of this manual.
- 2. Unfasten the cover assembly from the console.
- 3. Set the VHF console to the bolts.
- 4. Fasten the console with the bolts or nuts and weld nuts to the bulkhead.
- Fasten the cover assembly to the console.
 Note: To connect wires after you have hung the console, see section 2.12.
- 6. Fasten the handset hanger with two screws.
- 7. To fasten the optional emergency lamp, connect the cable to the terminal board, then fasten the lamp to the console. Refer to the interconnection diagram and outline drawing.

1. HOW TO INSTALL THE EQUIPMENT

This page is intentionally left blank.

2. CONNECTIONS

Connect external equipment at the rear of the transceiver unit.

2.1 Power Supply

2.1.1 Solas Convention vessels, 100/220 VAC ship's mains

Solas Convention vessels must supply both AC and DC power to the transceiver unit, through an AC/DC power supply unit. The AC/DC Power Supply Unit PR-240/241 is optionally available. When the AC input fails, the DC power is activated.

Connect the reserve source of energy to the DC IN terminal on the PR-240/241. Connect the AC ship's mains to the AC IN terminal on the PR-240/241.

Be sure to ground the unit.

2.1.2 Radio battery

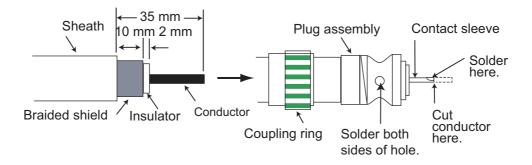

Attach the connector (supplied) to the power cable and connect the cable to the 24 VDC connector at the rear of the transceiver unit. Connect the wire ends to the radio battery line.

2.2 VHF Antenna

The VHF antenna is connected to the transceiver unit with a 50 ohm coaxial cable, type RG-10/U-Y. Make sure you leave some additional length in the cable for future service and maintenance.

Lay the coaxial cable and fasten an M-type plug to the cable (if necessary) as follows.

- 1. Remove the sheath by 35 mm.
- 2. Bare 23 mm of the center conductor. Trim the braided shield by 10 mm and tin.
- 3. Slide the coupling ring on the cable.
- 4. Screw the plug assembly on the cable.
- 5. Solder plug assembly to the braided shield through the solder holes. Solder the contact sleeve to the conductor.
- 6. Screw the coupling ring into the plug assembly.
- 7. Screw the plug into the ANT connector at the rear of the transceiver unit.

2.3 CH70 RX Antenna

The CH70 RX antenna is connected to the transceiver unit with a 50 ohm coaxial cable, type RG-10/U-Y. Attach an M-type plug to the cable (if necessary) as shown above. Screw the plug into the CH70 RX ANT connector at the rear of the transceiver unit.

2.4 Handset HS-2003

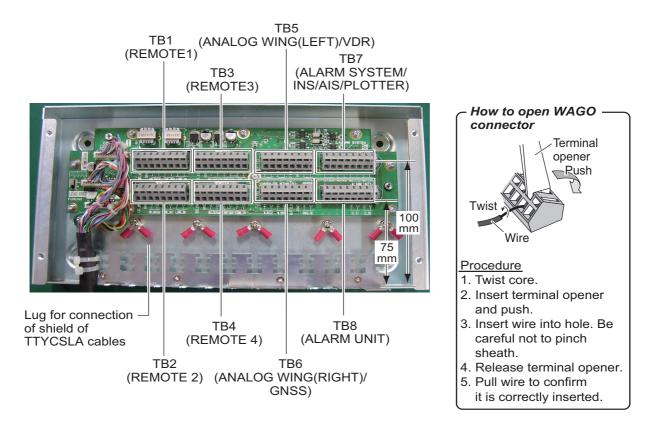

Connect the handset HS-2003 to the HANDSET connector on the front panel.

2.5 How to Ground the Transceiver Unit

Fasten a ground wire (local supply) between the GND terminal at the rear of the transceiver unit and ship's hull (or ground bus).

2.6 Junction Box

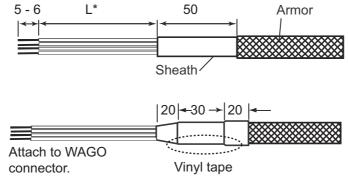

The junction box connects external equipment to the transceiver unit. The cable that connects between the junction box and the transceiver unit is pre-connected to the junction box. WAGO connectors connect the external equipment. A terminal opener is provided inside the junction box to open terminals on the connectors. See the illustration below for how to use the opener. Terminal lugs are provided to connect the shield of the TTYCSLA cables.

2.6.1 How to prepare the cables of external equipment

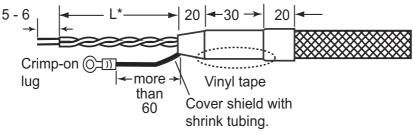

The cables shown are JIS (Japan Industry Standard) cables. See the Appendix for the equivalent cables.

Cable MPYC-4 (Alarm system)

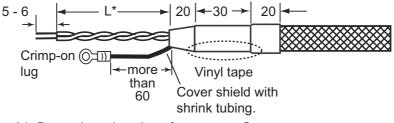

L*=Depends on location of connector. See illustration of junction box on page 9 for length.

Cable TTYCSLA-1 (NAV equipment)

L*=Depends on location of connector. See illustration of junction box on page 9 for length.

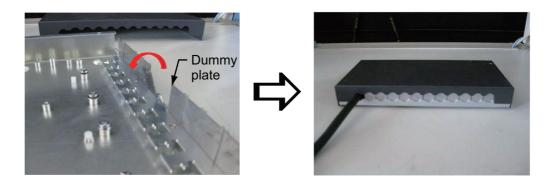

Cable TTYCSLA-4 (Alarm Unit IC-350, INS, AIS, Plotter, MIC Receptacle Box, Remote Handset

L*=Depends on location of connector. See illustration of junction box on page 9 for length.

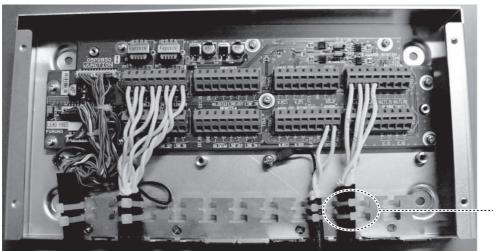

2.6.2 Dummy plates in cable slots

Dummy plates are inserted at the factory in all but three cable slots. Remove or insert the dummy plates as necessary. Cover unused cable slots to comply to Ingress Protection Rating IP2x.

2.6.3 How to fasten the cables to the Junction Box

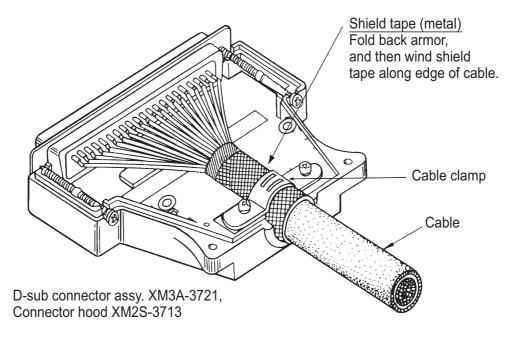

Connect cables to related connectors. Fasten the cables to the cable posts with two cable ties.

 Fasten cable to post with two cable ties.

2.7 How to Connect the Remote Station without the Junction Box

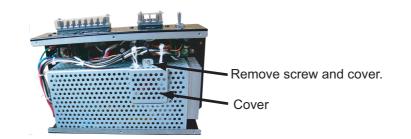

The remote station (MIC receptacle box, etc.) can be connected directly to the transceiver unit, using the D-sub connector supplied as installation materials. Attach the connector to the cable as follows.

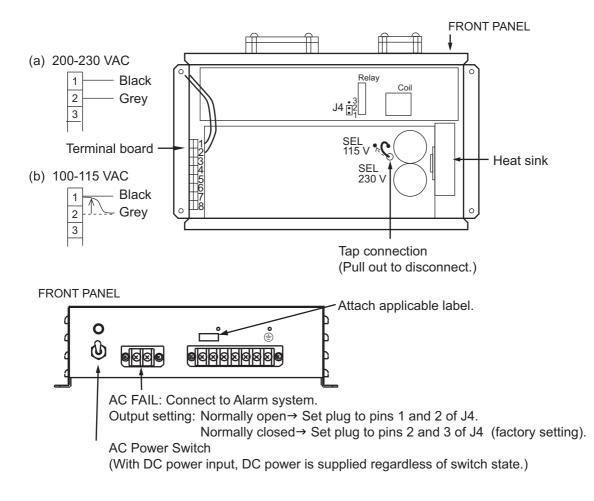

2.8 AC/DC Power Supply Unit PR-240

The AC/DC Power Supply Unit PR-240 is shipped ready for connection to 200-230 VAC. For connection to 100 VAC-115 VAC, change the tap connection and terminal board connection as below. Attach applicable label (supplied in accessories) to the front panel according to the ship's mains.

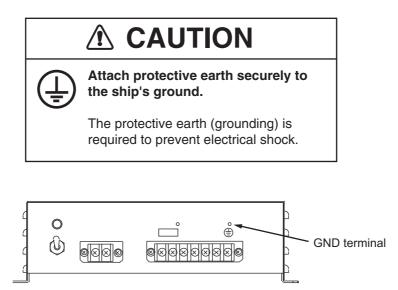

Power	Tap connection	Terminal board	Label
200-230 VAC	SEL 230 V	(a) in figure below	200-230 VAC, 2.2-1.7 A, 1φ, 50/60 Hz
100-115 VAC	SEL 115 V	(b) in figure below	100-115 VAC, 3.2-2.6 A, 1φ, 50/60 Hz

Protective earth

Connect a IV-2sq wire between the ship's ground and the ground terminal on the PR-240 to prevent electrical shock.

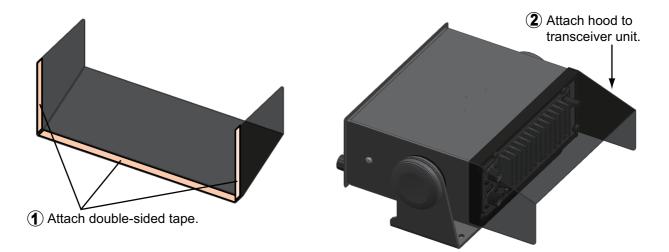

2.9 When the Handset HS-2003 is not Connected to the Transceiver Unit

When the Handset HS-2003 is not connected to the transceiver unit; namely, the remote handset is used always, turn on [M-HS HOOK] in the [OTHER] menu. See section 4.6.

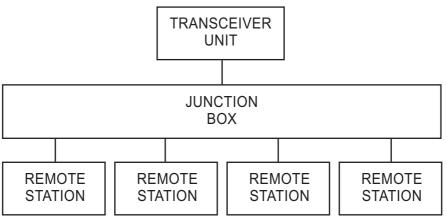

2.10 Rainproof Cover for Transceiver Unit

The optional rainproof cover kit (Type: 05-104-2601, Code No. 001-174-310-10), consisting of a protective hood and double-sided tape, protects the connectors at the rear of the transceiver unit from rain and water splash. The cover can be used with both the desktop and flush mount installation methods.Connect the cables to the transceiver unit then install the cover as shown below.

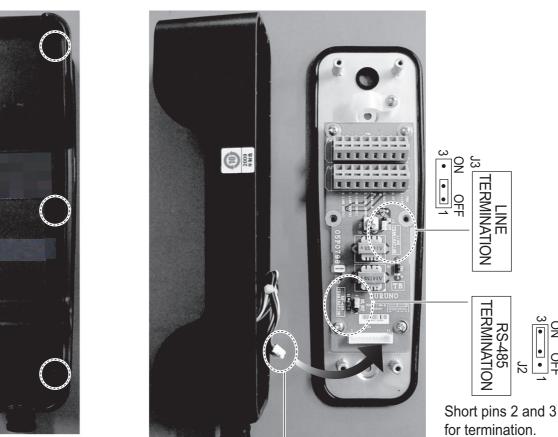

2.11 Jumper Setting for Termination

For termination on the remote stations, open the remote handset hanger as shown below. The default setting for J2 is "ON" (jumper block connected to pins 2 and 3). Confirm this setting. Re-connect the connector to the circuit board. Confirm that the plastic washers are in the screw holes in the handset hanger then close the hanger. Do this for all remote stations.

A maximum of four remote stations can be connected.

Unfasten six screws.

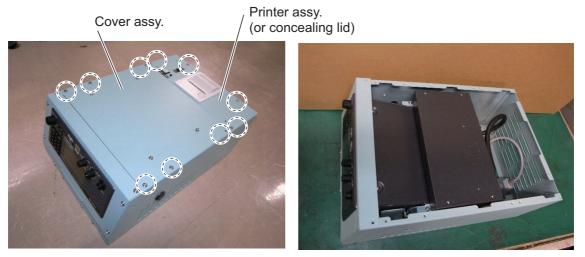

Disconnect connector from circuit board.

2.12 VHF Console

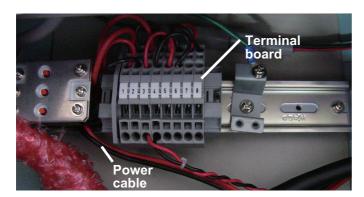

Install the VHF console following Chapter 3, then following the procedure in this section.

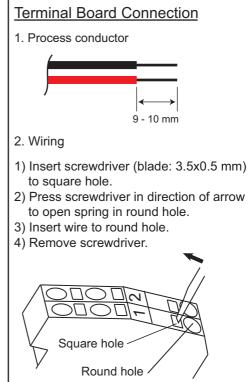

VHF console

1. Remove the cover assembly and printer assembly (or concealing lid) from the console. For the printer assembly, remove the cables connected to the transceiver unit and the terminal board.

Connect the power cable from the power supply to the terminal board 1 (+) and 2 (-).

2. CONNECTIONS

3. Connect the antenna coaxial cable as shown below.

GNSS cable

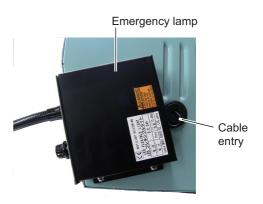

How to connect the coaxial cable:

- 1. Make a loop in the coaxial cable.
- 2. Fasten the coaxial cable to the GNSS cable with a cable tie.
- 3. Fasten the coaxial cable to the coaxial connector from the Junction Box.
- 4. Connect the ground wire from the ship to each ground terminal for the transceiver unit and the junction box.
- 5. Connect the cables from external equipment to the junction box and transceiver unit.
- 6. Fix the printer assembly (or concealing lid) and the cover assembly.

Emergency lamp

The emergency lamp can be installed on the left or right side (default arrangement) of the rack. For installation on the left side, unfasten the four screws from the front panel of the emergency lamp, rotate the emergency lamp 180° then refasten the screws.

- 1. Remove four screws from the right or left side of the rack.
- 2. Fasten the emergency lamp to the rack, with the four screws removed at step 1.

- 3. Insert the cable from the emergency lamp base into the cable entry of the rack. Connect the cable to the terminal board, referring to the interconnection diagram at the back of this manual.
- 4. Connect the emergency lamp connector to the emergency lamp.

2.13 I/O Data

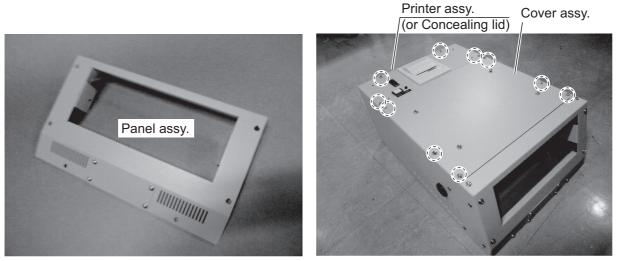

Data	Input/Output	Sentence, priority order
UAIS VHF Data-link Message	Input	VDM
Alert Acknowledge	Input	ACK
Alert State	Output	ALR
DSC information, Expanded DSC	Output	DSC, DSE
Equipment Information	Input/Output	PFEC
Position Info, Position Fix	Input	GNS>GGA>RMC>GLL
Target Latitude and Longitude	Output	TLL*
Time Info	Input	ZDA>RMC

* The TLL sentence can be output by selecting [TLL-S] on the [OTHER] menu of the [SERVICE] menu.

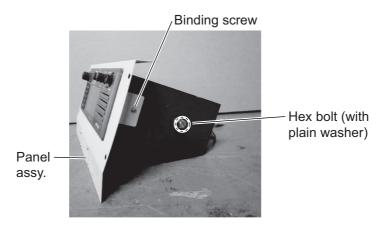

3. HOW TO ASSEMBLE THE VHF CONSOLE KIT

A VHF console kit is required to install the transceiver unit in the VHF console. There are two types of consoles, with a printer and without a printer.

1. Remove the cover assembly, the panel assembly and the printer assembly (or concealing lid) from the console. For the printer assembly, remove the cable connected to the terminal board.

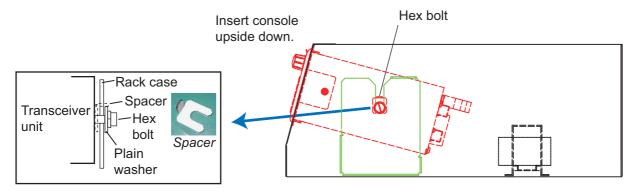

2. Fasten the panel assembly to the transceiver unit with the binding screws (use binding screws of the transceiver unit). Loosely insert M8×16 hex bolt (with plain washer) at both sides of the transceiver unit.

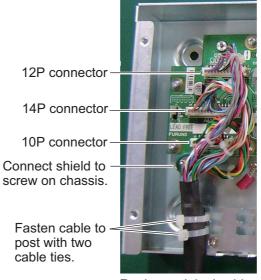

3. HOW TO ASSEMBLE THE VHF CONSOLE KIT

3. Set the transceiver unit to the console upside down. Fasten the transceiver unit to the rack case as shown below.

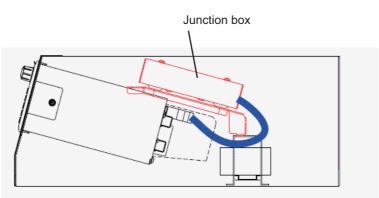

4. Replace the cable attached to the junction box with the cable (55 cm, 37-pin Dsub) supplied with the console kit. Connect the cable (37-pin D-sub) attached to the junction box to the transceiver unit.

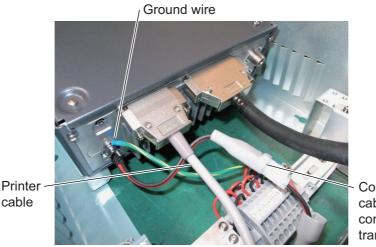

Replace original cable with cable assembly DSUB37M-PHX3-L550.

5. Fasten the junction box to the console and connect it to the transceiver unit.

- 6. Connect the following to the transceiver unit:
 - · fuse to the power connector on the transceiver unit
 - For the console with printer, connect the printer cable to the PRINTER port. (For no printer, fasten the concealing lid.)
 - ground wire

Connect power cable to the power connector on the transceiver unit.

7. Fasten the cover assembly.

Note: If the console assembly is to be installed on the hull, see sections 1.11 and 2.12.

3. HOW TO ASSEMBLE THE VHF CONSOLE KIT

This page is intentionally left blank.

4. INITIAL SETTINGS

This chapter shows you how to enter the initial settings, which requires a password. Refer to FURUNO Information for the password. Entry of the MMSI and ATIS ID* numbers also requires a short inside the junction box or at the rear panel of the transceiver unit. Under no condition can the password or the location of the shorting points be released to the operator.

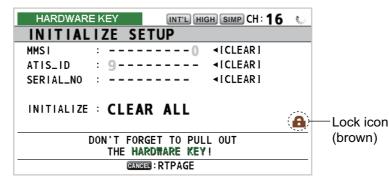

* ATIS is the acronym meaning Automatic Transmitter Identification System. ATIS is used on inland waterways in various countries in mainland Europe to identify ships. At the end of every transmission the radio sends a unique FFSK data signal that contains the user or ship's unique ATIS call sign. The FFSK signal identifies you to marine coast stations and inland stations.

4.1 How to Register the MMSI and ATIS ID

1. Do one of the procedures shown in the illustration below to enable the registering of the MMSI and ATIS ID numbers.

TRANSCEIVER UNIT	JUNCTION BOX
Use a shorting link or the like to short pin 6 and 23 on the supplied D-SUB connector. Attach the connector to the JUNCTION connector (D-sub	Open the junction box and set the jumper block J4 to pins 2 and 3 (OFF position) as shown below.
connector, 37 pin) at the rear of the transceiver unit.	
Connect supplied connector here.	NOTICE : Jumper blocks J5 and J6 are for testing at the factory. Do not change the settings.

2. Turn on the transceiver unit. The [INITIALIZE SETUP] menu appears, with the indication "HARDWARE KEY" and the "lock icon" shown.

3. Enter the password. The lock icon turns green, the shackle of the lock opens and the cursor selects the MMSI. Push the **CH** knob to show the MMSI input box.

4-1

- 4. Use the numeric keys to enter the MMSI. Confirm the number then push the **CH** knob to submit the number.
- If applicable, enter the ATIS ID like how you entered the MMSI.
 Note: You can re-enter the MMSI/ATIS ID if it is wrong. Select the applicable
 ◄[CLEAR] then push the CH knob. You are asked if it is OK to clear the number.
 Select [Yes] then push the CH knob. Select the number location then push the CH knob. Reenter the number.
- 6. Turn off the transceiver unit.
- Do one of the following according to the action taken at step 1 to write the MMSI (and ATIS ID if applicable) to the memory.
 Junction box: Restore the jumper block to its original position (connect jumper block to pins 1 and 2) and close the junction box.
 Transceiver unit: Remove the connector.

Note: If you do not restore the jumper block to its original position or remove the shorting link, the message "HARDWARE KEY" appears at the top-left corner of the standby screen.

4.2 Service Menu

A password is required to open the [SERVICE] menu. Refer to the appropriate FURU-NO Information for how to open the [SERVICE] menu.

[for DEVELOP]

The items in this column are for use by developers. Do not change the settings.

P-BROWSER: Activate or deactivate the parameter browser, which is controlled from a PC. For use by the service technician.

AMS MODE: [AMS MODE] selects whether an AMS (Alert Management System) is connected to this radio or not. AMS includes Bridge Alert Management System (BAMS).

There are three choices; [LEGACY], [AlertIF1] and [AlertIF2].

[AlertIF1] uses the following input/output sentences: ALR/ACK.

[AlertIF2] uses the following input/output sentences: ALF, ALC, ARC, HBT, ACN for BAMS.

MULTI PORT: Select the equipment connected to the serial port. [AIS/AMS] (AIS transponder/AMS (Alert Management System)), [PLOTTER] (Navigational Plotter) or [INS] (Integrated Navigation System).

ALARM UNIT: Select [CONNECT] if the Alarm Unit IC-350 is connected to the radiotelephone. **PRINTER**: Choose the printer model connected to the radiotelephone.

[TYPE-A]: PP-520 [TYPE-B]: PP-8800A [OTHER]: Other printer

M-HS HOOK: Select where the main handset is connected. When the handset is not connected to the transceiver unit, and this setting is [NORMAL] (default setting), the system recognizes OFFHOOK state, preventing use of the remote station.

[NORMAL]: Select if the handset is connected to the transceiver unit.

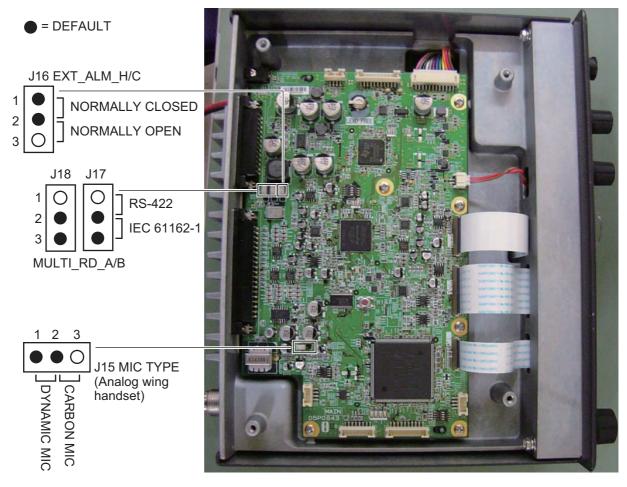

[F(ON)]: The software forcibly sets ONHOOK state at the transceiver unit. Use this setting if the handset is not connected to the transceiver unit; namely, the remote handset is used always. [F(OFF)]: The software forcibly sets OFFHOOK state.

4.3 Settings Inside the Transceiver Unit

Various jumper blocks are provided inside the transceiver unit to customize the system according to local regulations, user requirements, specifications, etc.

4.3.1 MIC type, MULTI SIO port receive format type, alarm output

Turn the transceiver unit upside down. Remove the cover to show the MAIN board (05P0843). Set the jumper blocks as required, referring to the illustration below. Jumper block information is also printed on the label on the inside cover.

J15: Set the type of analog wing handset MIC used, carbon or dynamic.

J16: Define alarm output, normally closed or normally open.

J17, J18: Select the type of receiving circuit to use on the MULTI SIO port, RS-422 or IEC 61162-1 (Opt-Coupler). Set both jumpers to the same setting.

4. INITIAL SETTINGS

4.3.2 VHF antenna only

If a CH70 antenna is not installed, CH70 can be received with a VHF TX-RX antenna. Do the modification below to enable CH70 reception with a VHF TX-RX antenna. Note however that CH70 cannot be received during VHF transmission.

Remove the outer cover and the shield cover to show the TRX_WR Board (05P0841).Connect the supplied mini-pin assy. as shown below.

1. Disconnect the mini-pin from J2.

2. Connect the supplied mini-pin assy. between J2 and J3. Use vinyl tape to attach the cable disconnected at step 1 to the chassis or the W9 connector assy.

APPX. 1 JIS CABLE GUIDE

Cables listed in the manual are usually shown as Japanese Industrial Standard (JIS). Use the following guide to locate an equivalent cable locally.

JIS cable names may have up to 6 alphabetical characters, followed by a dash and a numerical value (example: DPYC-2.5).

For core types D and T, the numerical designation indicates the *cross-sectional Area (mm²)* of the core wire(s) in the cable.

For core types M and TT, the numerical designation indicates the number of core wires in the cable.

1. Core Type

2. Insulation Type P: Ethylene Propylene Rubber

- D: Double core power line
- T: Triple core power line
- M: Multi core
- TT: Twisted pair communications (1Q=quad cable)

Designation type

- 4. Armor Type
- C: Steel

EX:

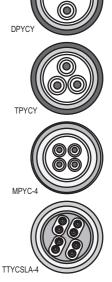

Y: Anticorrosive vinyl sheath

6. Shielding Type

3. Sheath Type

Y: PVC (Vinyl)

SLA: All cores in one shield, plastic tape w/aluminum tape -SLA: Individually shielded cores, plastic tape w/aluminum tape

The following reference table lists gives the measurements of JIS cables commonly used with Furuno products:

Designation type
